An initial analysis of an ongoing, multicenter case-control study indicates that women who have used oral contraceptives are approximately half as likely to develop ovarian and endometrial cancer as women who have never used them and that, despite previous concerns, contraceptive use does not appear to increase a woman's risk of breast cancer. The study used population-based cancer registries in eight geographic regions across the United States to identify women 20-54 years of age with newly ...

Case Study #1. Janice At 38 years old, Janice was diagnosed with Stage IIIC ovarian cancer and underwent successful surgery followed by 6 cycles of chemotherapy with carboplatin and taxol. She achieved a complete remission and did well for 18 months before her CA 125 level began rising even though CT scans revealed no evidence of disease. Eventually, the CA 125 level reached 60U/ml, but her CT scans were still normal. Without any radiographic evidence of disease, Janice's original physician ...
